

EPA Products Ltd Light Tracker

The **LIGHT TRACKER SYSTEM** is designed to maintain a pre-set light intensity for buildings with natural light entry.

Basic operation:

The system is to be used with an existing dimmable lighting system. The operator simply adjusts the brilliance of the lighting to their requirements. When natural light enters the building, the **LIGHT TRACKER** will automatically lower the intensity of the main lighting, to the required lighting intensity set by the operator. When the natural light entering the building diminishes, the **LIGHT TRACKER** will increase the light intensity, of the main lights to the required light intensity.

- Light Tracker system can monitor and maintain the light intensity with either one to four light sensors located within the building.
- Designed for broiler sheds fitted with windows and free range poultry sheds.
- Can be retro fitted to most EPA Lighting Control systems
- Especially suited to the ALIS Lighting System
- Can be retro fitted to most systems with 1-10v control.
- Unaffected by simulated Dusk Dawn / Sun rise, Sun set lighting control
- Easy to set up and use.
- Maintain a light intensity and save power
