

OCTOVENT 8 STAGE THERMOSTAT

Eight stage sequential thermostat with individual differential between each stage of ventilation adjustable to 0.05c.

Logic control recorder operates every two minutes and logs the stage level of ventilation, and holds the stage level in the event of the temperature probe failure or probe signal cable breaks or disconnects.

Adjustable delay timer for switching each stage level of ventilation in the vent of power restore above the set point temperature. Also acts as a delay to increase or decrease stage levels of ventilation as the temperature changes within the poultry shed.

High/Low temperature alarm and High/Low temperature recorder built in cycle timer for operation below set point temperature.
